1 Introduction

LTEIMS is an IMS standalone simple server. It has a built-in P-CSCF, I-CSCF, S-CSCF, HSS. It also allows SMS handling including SMS over SG by connecting to the Amarisoft MME.

2 Features

- Implements P-CSCF with built-in I-CSCF, S-CSCF and HSS.
- Support of SIP protocol.
- Support of MD5, AKAv1 and AKAv2 authentication.
- Support of ISIM cards using the XOR, Milenage or TUAK authentication algorithm.
- Support of IPsec (ESP/transport).
- Support of voice, video calls: MO and MT.
- Support of voice echo test.
- Support of hold.
- Support of SMS (GSM 3.40) using SIP MESSAGE and SMS over SG.
- Support of IPv4 and IPv6.
- Support of precondition and dedicated bearer using Rx interface.
- Support of emergency call.
- Configurable user database.
- External authentication using Cx interface.
- Command line monitor.
- Remote API using WebSocket.

3 Requirements

3.1 Hardware requirements

- LTEIMS can run on the same PC as the Amarisoft eNodeB if a simple and compact solution is needed. Otherwise, any reasonably recent PC with at least one Gigabit Ethernet port is acceptable.
- A VoLTE compatible UE is necessary (See [VoLTE Call], page 5, note that it may depends on UE).
- A test USIM with ISIM application should be plugged into the UE. IMSI and secret key must be known. A standard USIM may also work but it depends on the UE implementation.

3.2 Known compatible UE

The Amarisoft IMS server has been tested with the following UE models:

- Samsung S5
- LG MS870

3.3 Software requirements

- A 64 bit Linux distribution. Fedora 34 is the officially supported distribution. The following distributions are known as compatible:
 - Fedora 22 to 34
 - Cent OS 7
 - Ubuntu 14 to 20

Your system requires at least GLIBC 2.17.

4 Installation

The network access thru the Gigabit Ethernet port must be correctly configured.

LTEIMS can be run directly from the directory when it was unpacked. No need for explicit installation.

4.1 Fedora setup

If you want to use SMS over SG with the Amarisoft MME or precondition with QoS, you need support of SCTP protocol for which the necessary packages are not usually installed. In order to install them, do as root user:

- Fedora

```
dnf install lksctp-tools kernel-modules-extra
```

- Ubuntu

```
sudo apt-get install lksctp-tools linux-image-extra-3.13.0-24-generic
```

Note that linux-image-extra package name may differ depending on your kernel version.

To verify that SCTP kernel module is running, do as root user:

```
checksctp
```

If it reports that the protocol is not supported,

- check if you have a `/etc/modprobe.d/sctp-blacklist.conf` file
- edit it to comment the 'blacklist sctp' line

Then reboot the PC in case the Linux kernel was upgraded too.

4.2 License key installation

LTEIMS needs a LTEMME license key to run. Please refer to the `ltemme` documentation.

4.3 Initial testing

- Edit the file `config/ims.cfg` to set the address of the SIP interface. Normally it is the address of the Ethernet interface that will receive SIP packets.
You can keep the current config if you use it with the Amarisoft MME and its `config/mme-ims.cfg` config file.
- Start the program as root with:

```
./lteims config/ims.cfg
```

[The root access is only needed if you want IPsec support.]

- The command line interface is used to monitor the operation of LTEIMS and to change the logging options.
Use `help` to get the list of commands and `quit` to stop the program.
- Use `users` to list the user database and registering state.

4.4 Samsung S5 configuration

Your UE must run at least Android 5.0 (Even if Android 5.0 is installed, try to update software (several times) as a sub-release is necessary).

If not, please update it.

To check your UE is configured for VoLTE, please go to **Settings/More networks/Mobile networks** of your handset and check **VoLTE Call** is checked:

We assume you are using the system with Amarisoft MME and `config/mme-ims.cfg` config file.

As there are two PDN defined, you must add them to the UE.

- Go to Settings/More networks/Mobile networks
- Turn on Data roaming
- Check VoLTE Call (If not present, it means your device is not up to date or does not support VoLTE).
- Go to Network operators, search for networks and select Amarisoft network.

- Go back to Mobile network.
- Add the first APN with the following parameters:
 - Name = Internet
 - APN = internet
 - APN type = default
- Save it and select it.
- Add second APN with following parameters:
 - Name = IMS
 - APN = ims
 - APN type = ims
- Save it and do not select it (This APN may not be displayed).
- Reboot your phone

5 Configuration reference

5.1 Configuration file syntax

The main configuration file uses a syntax very similar to the Javascript Object Notation (JSON) with few extensions.

1. Supported types:
 - Numbers (64 bit floating point). Notation: `13.4`
 - Complex numbers. Notation: `1.2+3*I`
 - Strings. Notation: `"string"`
 - Booleans. Notation: `true` or `false`.
 - Objects. Notation: `{ field1: value1, field2: value2, }`
 - Arrays. Notation: `[value1, value2,]`
2. The basic operations `+`, `-`, `*` and `/` are supported with numbers and complex numbers. `+` also concatenates strings. The operators `!`, `||`, `&&`, `==`, `!=`, `<`, `<=`, `>=`, `>` are supported too.
3. The numbers 0 and 1 are accepted as synonyms for the boolean values `false` and `true`.
4. `{}` at top level are optional.
5. `"` for property names are optional, unless the name starts with a number.
6. Properties can be duplicated.

Merge will be done by recursively overriding values considering reading direction.

```
{
  value: "foo",
  value: "bar",
  sub: {
    value: "foo"
  },
  sub: {
    value: "bar"
  }
}
```

Will be equivalent to:

```
{
  value: "bar",
  sub: {
    value: "bar"
  }
}
```

7. Files can be included using *include* keyword (must not be quoted) followed by a string (without `:`) representing the file to include (path is relative to current file) and terminating by a comma.

Arrays can't be included.

Merge will be done as for duplicate properties.

If *file1.cfg* is:

```
value: "foo",
include "file2.cfg",
foo: "foo"
```

And *file2.cfg* is:

```
value: "bar",
```

```

    foo: "bar"
Final config will be:
{
    value: "bar",
    foo: "foo"
}

```

8. A C like preprocessor is supported. The following preprocessor commands are available:

```

#define var expr
    Define a new variable with value expr. expr must be a valid JSON expres-
    sion. Note that unlike the standard C preprocessor, expr is evaluated by the
    preprocessor.

#undef var
    Undefine the variable var.

#include expr
    Include the file whose filename is the evaluation of the string expression expr.

#if expr
    Consider the following text if expr is true.

#else
    Alternative of #if block.

#elif
    Composition of #else and #if.

#endif
    End of #if block.

#ifdef var
    Shortcut for #if defined(var)

#ifndef var
    Shortcut for #if !defined(var)

```

In the JSON source, every occurrence of a defined preprocessor variable is replaced by its value.

9. Backquote strings: JSON expression can be inserted in backquote delimited strings with the `${expr}` syntax. Example: `'abc${1+2}d'` is evaluated as the string `"abc3d"`. Preprocessor variables can be used inside the expression.

The System Information Blocks use the ASN.1 GSER syntax defined in RFC 3641 (Generic String Encoding Rules for ASN.1 Types). The description of the exact content of the System Information Blocks can be found in 3GPP TS 36.331 (RRC).

5.2 Properties

log_filename

String. Set the log filename. If no leading `/`, it is relative to the configuration file path. See [Log file format], page 29.

log_options

String. Set the logging options as a comma separated list of assignments.

- `layer.level=verbosity`. For each layer, the log verbosity can be set to `none`, `error`, `info` or `debug`. In debug level, the content of the transmitted data is logged.
- `layer.max_size=n`. When dumping data content, at most `n` bytes are shown in hexa. For ASN.1, NAS or Diameter content, show the full content of the message if `n > 0`.

- *layer.payload*=[0|1]. Dump ASN.1, NAS, SGsAP or Diameter payload in hexadecimal.
- *layer.key*=[0|1]. Dump security keys (NAS and RRC layers).
- *layer.crypto*=[0|1]. Dump plain and ciphered data (NAS, RRC and PCDP layers).
- *time*=[sec|short|full]. Display the time as seconds, time only or full date and time (default = time only).
- *time.us*=[0|1]. Dump time with microseconds precision.
- *file=cut*. Close current file log and open a new one.
- *file.rotate=now*. Rename current log with timestamp and open new one.
- *file.rotate=size*. Rename current log every time it reaches *size* bytes open new one. Size is an integer and can be followed by K, M or G.
- *file.path=path*. When log rotation is enabled, move current log to this path instead of initial log path.
- *append*=[0|1]. (default=0). If 0, truncate the log file when opening it. Otherwise, append to it.

Available layers are: **ims**, **sip**, **media**, **rx**, **cx**

log_sync Optional boolean (default = false). If true, logs will be synchronously dumped to file.

Warning, this may lead to performances decrease.

sip_addr Array. Each item is an object representing a SIP server socket defined as follow:

addr String. Set the IP address (and an optional port) on which IMS server will listen for SIP packets. The default port is 5060.

bind_addr Optional string. Defines network interface on which IMS will listen. If not specified, the **addr** parameter is used.

port_min Optional integer (Default is 10000). Defines lower bound of UDP media socket.

port_max Optional integer (Default is 20000). Defines upper bound of UDP media socket.

NB:

- SIP socket object can be represented by a simple string. Thus, it will represent **addr** parameter and all other parameters will use default value.
- For legacy, **sip_addr** can be a single SIP socket (Object or String) instead of an Array.

sctp_addr String. Set the IP address (and an optional port) for MME connection. This is only necessary for SMS over SG feature.

cx_server_addr String. Set the IP address (and optional port) of Cx SCTP connection to the HSS. The default port is 3868.

cx_bind_addr Optional string. IP address and optional port on which the Cx SCTP connection is bound. If not set, **sctp_addr** is used.

<code>cx_origin_realm</code>	Optional string. Defines the string sent in the Origin-Realm AVP for Cx messages. Default is set to <code>amarisoft.com</code> .
<code>cx_origin_host</code>	Optional string. Defines the string sent in the Origin-Host AVP for Cx messages. Default is set to <code>ims.amarisoft.com</code> .
<code>cx_watchdog_duration</code>	Optional integer (range 0 to 36000000, default = 0). Tw watchdog timer in milliseconds to send the Diameter Device Watchdog Request message. The value 0 deactivates the watchdog.
<code>rx_server_addr</code>	Optional string. Set the IP address (and optional port) of Rx SCTP connection to the MME. The default port is 3868. If not set, <code>cx_server_addr</code> is used.
<code>rx_bind_addr</code>	Optional string. IP address and optional port on which the Rx SCTP connection is bound. If not set, <code>cx_bind_addr</code> is used.
<code>rx_origin_realm</code>	Optional string. Defines the string sent in the Origin-Realm AVP for Rx messages. Default is set to <code>amarisoft.com</code> .
<code>rx_origin_host</code>	Optional string. Defines the string sent in the Origin-Host AVP for Rx messages. Default is set to <code>ims.amarisoft.com</code> .
<code>rx_watchdog_duration</code>	Optional integer (range 0 to 36000000, default = 0). Tw watchdog timer in milliseconds to send the Diameter Device Watchdog Request message. The value 0 deactivates the watchdog.
<code>domain</code>	String. Global SIP domain used for IMPU and authentication. May be overridden at user level. This parameter is not used to recover IMPU.
<code>tcp_threshold</code>	Optional integer (default = 1300). Set packet threshold in bytes to use TCP instead of UDP.
<code>tcp_keepalive</code>	Optional integer (default = 1800). Time in seconds before sending keepalive on TCP connections. 0 means disabling keepalive.
<code>session_expires</code>	Optional integer (default = 3600); Set session expires header value in seconds.
<code>100rel</code>	Optional Boolean (default = true). Enable/disable 100rel support.
<code>precondition</code>	Optional string (default = on). Values can be "on", "off" or "silent". On: IMS will handled QoS according to the standard. Off: no precondition and no dedicated bearer establishment. Silent: dedicated bearers will be established regardless the SIP and SDP content. Note that a Rx connection is necessary to allow dedicated bearer establishment.
<code>p_called_party_id</code>	Optional boolean (default is false). Enable P-Called-Party-ID header for INVITE and MESSAGE requests.

- sdp_file** Optional string. When used in echo mode, use the SDP file to force the media sent in server SDP response.
- ipsec** Optional boolean (default is true). Enable/disable support of ipsec.
- ipsec_aalg_list**
Array of strings. Each string represent IPsec authentication algorithm supported by IMS.
"null" may be used to indicate no authentication.
- ipsec_ealg_list**
Array of strings. Each string represent IPsec encryption algorithm supported by IMS. "null" may be used to indicate no encryption.
- dialog_timeout**
Optional integer (default = 30). Time in seconds of call session. Stop call if no activity has been detected during this time.
- auth_on_register_only**
Optional boolean (default = false). If true, don't try to authenticate other request than register.
- com_addr** Optional string. Address of the WebSocket server remote API. See [Remote API], page 16.
If set, the WebSocket server for remote API will be enabled and bound to this address.
Default port is 9003.
Setting IP address to 0.0.0.0 will make remote API reachable through all network interfaces.
- com_name** Optional string. Sets server name. IMS by default
- com_ssl_certificate**
Optional string. If set, forces SSL for WebSockets. Defines CA certificate filename.
- com_ssl_key**
Optional string. Mandatory if *com_ssl_certificate* is set. Defines CA private key filename.
- com_ssl_peer_verify**
Optional boolean (default is false). If *true*, server will check client certificate.
- com_auth** Optional object. If set, remote API access will require authentication.
Authentication mechanism is describe in [Remote API Startup], page 18, section.
- passfile** Optional string. Defines filename where password is stored (plaintext).
If not set, **password** must be set
- password** Optional string. Defines password.
If not set, **passfile** must be set.
- unsecure** Optional boolean (default false). If set, allow password to be sent plaintext.
NB: you should set it to true if you access it from a Web Browser (Ex: Amarisoft GUI) without SSL (https) as your Web Browser may prevent secure access to work.

license_server

Configuration of the Amarisoft license server to use.

Object with following properties:

server_addr

String. IP address of the license server.

name Optional string. Text to be displayed inside server monitor or remote API.

tag Optional string. If set, server will only allow license with same tag.

Example:

```
license_server: {
  server_addr: "192.168.0.20"
}
```

sms_expires

Integer (default = 86400). Delay in seconds before SMS is removed from database

sms_hook_only

Optional boolean (default = false). If set, when SMS is received and at least one WebSocket client has registered to **sms** event, don't process SMS internally (Only CP/RP layer will be handled).

binding_expires

Integer (default = 3600, max = 864000). Default duration in seconds for registration.

subscribe_expires

Integer (default = 0, max = 864000). Subscription expiration. If set to 0, use value sent by UE.

user_agent

String. SIP user agent.

force_user_agent

Boolean (default = true). If true, IMS user-agent will always be used, else remote peer's one will be used.

timer_t1 Optional number (default = 2). SIP T1 timer duration in seconds.

timer_t2 Optional number (default = 16). SIP T2 timer duration in seconds.

timer_t4 Optional number (default = 17). SIP T4 timer duration in seconds.

custom_headers

Array of object. Each object represents a custom header to add to requests and/or responses, defined as follows:

name Header name

value Header value

codes Number or array of numbers of the SIP responses on which to apply custom headers.
0 can be used for all codes.

methods String or array of strings of the SIP method on which to apply custom headers.
* can be used for all methods.

If **codes** is set, the custom headers will be applied to the responses of the associated request.

- replace** Optional boolean (default = false). If set, allow only one occurrence of the header.
- sms_retry_delay** Integer. Time in s to retry SMS sending.
- echo** String. If set, this defines the phone number for echo service.
- mt_call_sdp_file** String. File to use as SDP when using MT call.
- sms_message_filter** Optional object. Allows to define the IMS behavior for a list of SMS related messages.
Each property name represents a SMS message type. The ones currently supported are **cp_data**, **cp_ack**, **rp_data** and **rp_ack**.
Each property value is an enum: **treat** (message is processed), **ignore** (message is ignored) or **reject** (message is rejected).
By default all procedures are treated.
- Example:
- ```

sms_message_filter: {
 cp_data: "treat",
 rp_ack: "reject"
}

```
- sms\_forced\_cp\_cause** Optional integer (range 0 to 255). Allows to override the CP error cause selected by the IMS with the one configured. Set to 0 to deactivate the override.
- sms\_forced\_rp\_cause** Optional integer (range 0 to 255). Allows to override the RP error cause selected by the IMS with the one configured. Set to 0 to deactivate the override.
- mms\_server\_bind\_addr** Defines network interface on which MMS server will listen. It is used to configure the MMSC in the UE. MMS proxy is not supported and shall not be configured in the UE.
- Example:
- ```

mms_server_bind_addr: "192.168.3.1:1111"
MMSC: http://192.168.3.1:1111

```
- mms_expires** Optional integer (default = 86400). Delay in seconds before MMS is removed from database.

5.2.1 User database options

- ue_db** Array of objects. Configure the user database. Each element is an entry for one user. Note that this part can be shared between Amarisoft MME and IMS. The following properties are available:
- imsi** Optional string. Set the IMSI.
Shall be present if **nai** is absent.
- nai** Optional string. Network specific identifier-based SUPI.
Shall be present if **imsi** is absent.

<code>multi_sim</code>	Optional boolean (default = false). If true, allow several UEs to have the same IMSI (useful when using several identical test SIM cards in different UEs at the same time). They are distinguished with their IMEI. Note: it is only allowed with the XOR authentication algorithm.												
<code>impi</code>	String. Defines user IMPI. Must be fully filled with hostname if necessary. If you don't know your IMPI, please look at IMS logs inside <i>REGISTER</i> request. The IMPI must match the <i>username</i> argument inside <i>Authorization</i> header.												
<code>impu</code>	Array of string or object. Each string represent an IMPU and can be a sip URI or a telephone number. Note that sip URI must not include hostname. If IMPU does not start by a scheme, it is assumed to be a sip URI. Ex: <ul style="list-style-type: none"> • sip:user • user • tel:+33123456789 If <code>impu</code> is an object, it has following members: <table> <tr> <td><code>impu</code></td><td>IMPU as defined above.</td></tr> <tr> <td><code>imei</code></td><td>IMEI associated to this IMPU. Allows to filter calls and SMS for a specific UE. Only relevant if <code>multi_sim</code> is set to true.</td></tr> <tr> <td><code>code</code></td><td>Number. Only relevant for echo <code>impu</code>. Server will use this as SIP answer code. Set it to 0 to stop forcing the code value. Set it to -1 to force IMS not to answer. Else, code must be between 100 and 699.</td></tr> <tr> <td><code>method</code></td><td>String. If <code>code</code> is set, defines on which SIP method to apply <code>code</code>. Can be INVITE (default), REGISTER, UPDATE, PRACK CANCEL or MESSAGE. If set to INVITE.OK, <code>code</code> will be applied to final answer of INVITE request. If set to INVITE.TRYING, <code>code</code> will be sent after TRYING response. INVITE, REGISTER, UPDATE, PRACK and CANCEL will be applied on requests where <code>impu</code> matches the <code>to</code> SIP header of the request. Contrary to the previous methods, MESSAGE will be applied on requests where <code>from</code> SIP header matches <code>impu</code>.</td></tr> <tr> <td><code>content</code></td><td>String. If <code>code</code> is set, response body will be filled with <i>content</i> file.</td></tr> <tr> <td><code>content_type</code></td><td>String. Mandatory if <code>code</code> and <code>content</code> are set, will define response content type.</td></tr> </table>	<code>impu</code>	IMPU as defined above.	<code>imei</code>	IMEI associated to this IMPU. Allows to filter calls and SMS for a specific UE. Only relevant if <code>multi_sim</code> is set to true.	<code>code</code>	Number. Only relevant for echo <code>impu</code> . Server will use this as SIP answer code. Set it to 0 to stop forcing the code value. Set it to -1 to force IMS not to answer. Else, code must be between 100 and 699.	<code>method</code>	String. If <code>code</code> is set, defines on which SIP method to apply <code>code</code> . Can be INVITE (default), REGISTER, UPDATE, PRACK CANCEL or MESSAGE. If set to INVITE.OK, <code>code</code> will be applied to final answer of INVITE request. If set to INVITE.TRYING, <code>code</code> will be sent after TRYING response. INVITE, REGISTER, UPDATE, PRACK and CANCEL will be applied on requests where <code>impu</code> matches the <code>to</code> SIP header of the request. Contrary to the previous methods, MESSAGE will be applied on requests where <code>from</code> SIP header matches <code>impu</code> .	<code>content</code>	String. If <code>code</code> is set, response body will be filled with <i>content</i> file.	<code>content_type</code>	String. Mandatory if <code>code</code> and <code>content</code> are set, will define response content type.
<code>impu</code>	IMPU as defined above.												
<code>imei</code>	IMEI associated to this IMPU. Allows to filter calls and SMS for a specific UE. Only relevant if <code>multi_sim</code> is set to true.												
<code>code</code>	Number. Only relevant for echo <code>impu</code> . Server will use this as SIP answer code. Set it to 0 to stop forcing the code value. Set it to -1 to force IMS not to answer. Else, code must be between 100 and 699.												
<code>method</code>	String. If <code>code</code> is set, defines on which SIP method to apply <code>code</code> . Can be INVITE (default), REGISTER, UPDATE, PRACK CANCEL or MESSAGE. If set to INVITE.OK, <code>code</code> will be applied to final answer of INVITE request. If set to INVITE.TRYING, <code>code</code> will be sent after TRYING response. INVITE, REGISTER, UPDATE, PRACK and CANCEL will be applied on requests where <code>impu</code> matches the <code>to</code> SIP header of the request. Contrary to the previous methods, MESSAGE will be applied on requests where <code>from</code> SIP header matches <code>impu</code> .												
<code>content</code>	String. If <code>code</code> is set, response body will be filled with <i>content</i> file.												
<code>content_type</code>	String. Mandatory if <code>code</code> and <code>content</code> are set, will define response content type.												

transparent	Boolean. If <code>code</code> is set, the message will be sent without impacting the normal call flow.
anonymous	Optional boolean (default is false). If true, allow Anonymous connection (Emergency call).
authentication	Optional boolean (default is true). If false, disable authentication.
ring_only	Optional boolean (default is false). If true, IMS will go up to ringing state but not further.
precondition	Optional string. Values can be "on", "off" or "silent". On mode: IMS will try to guess precondition from supported header, SDP content and/or VoLTE compatibility of client. Off mode: no precondition and no dedicated bearer establishment. Silent mode: dedicated bearers will be established whatever the SIP and SDP content.
100rel	Optional boolean (default = true). Enable/disable 100rel support for this IMPU.
preferred	Optional boolean (default: false). If set, this <code>impu</code> will be used for preferred identity and for INVITE request URI.
asserted	Optional boolean (default: false). If set, this <code>impu</code> will be used for asserted identity.
associated	Optional boolean (default: true). If set to false, this <code>impu</code> will not be used for associated URI.
display_name	Optional string. If set, SIP headers will use this field for display name.
domain	Optional string. Used to override user or global config.
p_called_party_id	Optional string. If set, forces P-Called-Party-ID header for INVITE and MESSAGE requests, no matter if <code>p_called_party_id</code> global parameter is set or not.
answer_delay	Optional number. If set, when doing a echo call on this IMPU, OK response to INVITE request will be delayed by <code>answer_delay</code> in seconds.
remote_control	Optional boolean. If set to true on a echo <code>impu</code> , the sending of final of INVITE request will be controlled by <code>dialog_answer</code> remote API.

A remote API `invite` event will be sent with dialog `session_id`.

res_len Optional integer (default = 8). Defines length of response in bytes during authentication. For TUAK authentication algorithm, the value must be 4, 8 or 16 bytes long.

authent_type

Optional string (default = AKAv1). Defines minimum authentication level.

If client does not specify authentication algo, server will use this value.

Else, server will allow authentication only if client provided algo is at least the one specified by this parameter.

Values are (from lowest security to highest):

none Disable authentication.

MD5 MD5 digest authentication.

AKAv1 AKAv1 authentication.

AKAv2 AKAv2 authentication.

pwd Optional string. Password set for MD5 authentication. If set and *authent_type* is not set, *authent_type* is set to MD5.

mt_call_sdp_file

Optional string. File to use as SDP when using MT call. Overrides global parameter.

domain Optional string. If set, overrides global config.

auth_on_register_only

Optional boolean. If set, overrides global config.

force_sms_over_sg

Optional boolean. If set, forces use of SMS over SG.

ue_db_filename

Optional string. If present, store the current IMS state in a persistent file. The IMS state contains in particular the registration info and pending SMS.

6 Remote API

You can access LTEIMS via a remote API.

Protocol used is WebSocket as defined in RFC 6455 (<https://tools.ietf.org/html/rfc6455>).

Note that Origin header is mandatory for the server to accept connections. This behavior is determined by the use of `nopoll` library. Any value will be accepted.

6.1 Messages

Messages exchanged between client and LTEIMS server are in strict JSON format.

Each message is represented by an object. Multiple message can be sent to server using an array of message objects.

Time and delay values are floating number in seconds.

There are 3 types of messages:

- Request

Message sent by client.

Common definition:

message String. Represent type of message. This parameter is mandatory and depending on its value, other parameters will apply.

message_id

Optional any type. If set, response sent by the server to this message will have same message_id. This is used to identify response as WebSocket does not provide such a concept.

start_time

Optional double. Represent the delay before executing the message. If not set, the message is executed when received.

absolute_time

Optional boolean (default = false). If set, **start_time** is interpreted as absolute. You can get current clock of system using **time** member of any response.

standalone

Optional boolean (default = false). If set, message will survive WebSocket disconnection, else, if socket is disconnected before end of processing, the message will be cancelled.

- Response

Message sent by server after any request message as been processed.

Common definition:

message String. Same as request.

message_id

Optional any type. Same as in request.

time Number representing time in seconds.
 Usefull to send command with absolute time.

- Events

Message sent by server on its own initiative.

Common definition:

message String. Event name.

time Number representing time in seconds.
 Usefull to send command with absolute time.

6.2 Startup

When WebSocket connections is setup, LTEIMS will send a first message with name and type of PROG.

If authentication is not set, message will be **ready**:

```
{
  "message": "ready",
  "type": "IMS",
  "name": <name>
}
```

If authentication is set, message will be **authenticate** :

```
{
  "message": "authenticate",
  "type": "IMS",
  "name": <name>,
  "challenge": <random challenge>
}
```

To authenticate, the client must answer with a **authenticate** message and a **res** parameter where:

```
res = HMAC-SHA256( "<type>:<password>:<name>", "<challenge>" )
```

res is a string and HMAC-SHA256 refers to the standard algorithm (<https://en.wikipedia.org/wiki/HMAC>)

If the authentication succeeds, the response will have a **ready** field set to **true**.

```
{
  "message": "authenticate",
  "message_id": <message id>,
  "ready": true
}
```

If authentication fails, the response will have an **error** field and will provide a new challenge.

```
{
  "message": "authenticate",
  "message_id": <message id>,
  "error": <error message>,
  "type": "IMS",
  "name": <name>,
  "challenge": <new random challenge>
}
```

If any other message is sent before authentication succeeds, the error **"Authentication not done"** will be sent as a response.

6.3 Errors

If a message produces an error, response will have an error string field representing the error.

6.4 Sample nodejs program

You will find in this documentation a sample program: `ws.js`.

It is located in `doc` subdirectory.

This is a nodejs program that allow to send message to LTEIMS.

It requires nodejs to be installed:

```
dnf install nodejs npm
npm install nodejs-websocket
```

Use relevant package manager instead of NPM depending on your Linux distribution.

Then simply start it with server name and message you want to send:

```
./ws.js 127.0.0.1:9003 '{"message": "config_get"}'
```

6.5 Common messages

`config_get`

Retrieve current config.

Response definition:

type	Always "IMS"																										
name	String representing server name.																										
logs	Object representing log configuration. With following elements: <table> <tr> <td>layers</td><td>Object. Each member of the object represent a log layer configuration: <table> <tr> <td>layer name</td><td>Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table> </td></tr> </table> </td></tr> <tr> <td>count</td><td>Number. Number of bufferizer logs.</td></tr> <tr> <td>rotate</td><td>Optional number. Max log file size before rotation.</td></tr> <tr> <td>path</td><td>Optional string. Log rotation path.</td></tr> <tr> <td>bcch</td><td>Boolean. True if BCCH dump is enabled (eNB only).</td></tr> <tr> <td>rep</td><td>Boolean. True if NB-IoT repetitions logging is enabled (eNB only).</td></tr> <tr> <td>cch</td><td>Boolean. True if CCH dump is enabled (UE only).</td></tr> </table>	layers	Object. Each member of the object represent a log layer configuration: <table> <tr> <td>layer name</td><td>Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table> </td></tr> </table>	layer name	Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table>	level	See [log.options], page 8,	max_size	See [log.options], page 8,	key	See [log.options], page 8,	crypto	See [log.options], page 8,	payload	See [log.options], page 8,	count	Number. Number of bufferizer logs.	rotate	Optional number. Max log file size before rotation.	path	Optional string. Log rotation path.	bcch	Boolean. True if BCCH dump is enabled (eNB only).	rep	Boolean. True if NB-IoT repetitions logging is enabled (eNB only).	cch	Boolean. True if CCH dump is enabled (UE only).
layers	Object. Each member of the object represent a log layer configuration: <table> <tr> <td>layer name</td><td>Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table> </td></tr> </table>	layer name	Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table>	level	See [log.options], page 8,	max_size	See [log.options], page 8,	key	See [log.options], page 8,	crypto	See [log.options], page 8,	payload	See [log.options], page 8,														
layer name	Object. The member name represent log layer name and parameters are: <table> <tr> <td>level</td><td>See [log.options], page 8,</td></tr> <tr> <td>max_size</td><td>See [log.options], page 8,</td></tr> <tr> <td>key</td><td>See [log.options], page 8,</td></tr> <tr> <td>crypto</td><td>See [log.options], page 8,</td></tr> <tr> <td>payload</td><td>See [log.options], page 8,</td></tr> </table>	level	See [log.options], page 8,	max_size	See [log.options], page 8,	key	See [log.options], page 8,	crypto	See [log.options], page 8,	payload	See [log.options], page 8,																
level	See [log.options], page 8,																										
max_size	See [log.options], page 8,																										
key	See [log.options], page 8,																										
crypto	See [log.options], page 8,																										
payload	See [log.options], page 8,																										
count	Number. Number of bufferizer logs.																										
rotate	Optional number. Max log file size before rotation.																										
path	Optional string. Log rotation path.																										
bcch	Boolean. True if BCCH dump is enabled (eNB only).																										
rep	Boolean. True if NB-IoT repetitions logging is enabled (eNB only).																										
cch	Boolean. True if CCH dump is enabled (UE only).																										

dci_size	Boolean. True if the expected DCI size is logged (NR UE only).
csi	Boolean. True if computed CSI information dump is enabled (UE only).
cell_meas	Boolean. True if some cell related statistics dump is enabled (UE only).
signal	Boolean. True if PHY layer signal dump is enabled (eNB and UE only).

config_set

Change current config.

Each member is optional.

Message definition:

logs Object. Represent logs configuration. Same structure as config_get (See [config_get logs member], page 19).
All elements are optional.
Layer name can be set to **all** to set same configuration for all layers.

precondition

Optional boolean (default is false). If true, precondition with QoS will be handled by IMS.

IMS must be connected to MME to allow dedicated bearer establishment.

sms_retry_delay

Integer. Time in s to retry SMS sending.

sms_expires

Integer (default = 86400). Delay in seconds before SMS is removed from database

binding_expires

Integer (default = 3600). Default duration in seconds for registration.

subscribe_expires

Integer (default = 0, max = 864000). Subscription expiration. If set to 0, use value sent by UE.

auth_on_register_only

Optional boolean (default = false). If true, don't try to authenticate other request than register.

dialog_timeout

Optional integer (default = 30). Time in seconds of call session. Stop call if no activity has been detected during this time.

p_called_party_id

Optional boolean (default is false). Enable P-Called-Party-ID header for INVITE and MESSAGE requests.

sms_message_filter

Optional object. Allows to define the IMS behavior for a list of SMS related messages.

Each property name represents a SMS message type. The ones currently supported are **cp_data**, **cp_ack**, **rp_data** and **rp_ack**.

Each property value is an enum: **treat** (message is processed), **ignore** (message is ignored) or **reject** (message is rejected).
By default all procedures are treated.

Example:

```
sms_message_filter: {
  cp_data: "treat",
  rp_ack: "reject"
}
```

sms_forced_cp_cause

Optional integer (range 0 to 255). Allows to override the CP error cause selected by the IMS with the one configured. Set to 0 to deactivate the override.

sms_forced_rp_cause

Optional integer (range 0 to 255). Allows to override the RP error cause selected by the IMS with the one configured. Set to 0 to deactivate the override.

log_get Get logs.

Message definition:

min Optional number (default = 1). Minimum amount of logs to retrieve. Response won't be sent until this limit is reached (Unless timeout occurs).

max Optional number (default = 4096). Maximum logs sent in a response.

timeout Optional number (default = 1). If at least 1 log is available and no more logs have been generated for this time, response will be sent.

allow_empty

Optional boolean (default = false). If set, response will be sent after timeout, event if no logs are available.

rnti Optional number. If set, send only logs matching rnti.

ue_id Optional number. If set, send only logs with matching ue_id.

layers Optional Object. Each member name represents a log layer and values must be string representing maximum level. See [log_options], page 8. If *layers* is not set, all layers level will be set to *debug*, else it will be set to *none*.
Note also the logs is also limited by general log level. See [log_options], page 8.

short Optional boolean (default = false). If set, only first line of logs will be dumped.

headers Optional boolean. If set, send log file headers.

start_timestamp

Optional number. Is set, filter logs older than this value in milliseconds.

end_timestamp

Optional number. Is set, filter logs more recent than this value in milliseconds.

Response definition:

logs	Array. List of logs. Each item is a an object with following members:
data	Array. Each item is a string representing a line of log.
timestamp	Number. Milliseconds since January 1st 1970.
layer	String. Log layer.
level	String. Log level: <i>error</i> , <i>warn</i> , <i>info</i> or <i>debug</i> .
dir	Optional string. Log direction: <i>UL</i> , <i>DL</i> , <i>FROM</i> or <i>TO</i> .
ue_id	Optional number. UE.ID.
cell	Optional number (only for PHY layer logs). Cell ID.
rnti	Optional number (only for PHY layer logs). RNTI.
frame	Optional number (only for PHY layer logs). Frame number (Subframe is decimal part).
channel	Optional string (only for PHY layer logs). Channel name.
src	String. Server name.
idx	Integer. Log index.
headers	Optional array. Array of strings.
discontinuity	Optional number. If set, this means some logs have been discarded due to log buffer overflow.

Note that only one request can be sent by client.

If a request is sent before previous one has returned, previous one will be sent without machine min/max/timeout conditions.

log_set	Add log. Message definition:
log	Optional string. Log message to add. If set, <i>layer</i> and <i>level</i> are mandatory.
layer	String. Layer name. Only mandatory if <i>log</i> is set.
level	String. Log level: <i>error</i> , <i>warn</i> , <i>info</i> or <i>debug</i> . Only mandatory if <i>log</i> is set.
dir	Optional string. Log direction: <i>UL</i> , <i>DL</i> , <i>FROM</i> or <i>TO</i> .
ue_id	Optional number. UE.ID.
flush	Optional boolean (default = false). If set, flushes log file.
rotate	Optional boolean (default = false). If set, forces log file rotation.
cut	Optional boolean (default = false). If set, forces log file reset.
log_reset	Resets logs buffer.
quit	Terminates lteims.

help	Provides list of available messages in <i>messages</i> array of strings and events to register in <i>events</i> array of strings.
stats	Report statistics for LTEIMS. Every time this message is received by server, statistics are reset. Warning, calling this message from multiple connections simultaneously will modify the statistics sampling time. Response definition:
cpu	Object. Each member name defines a type and its value cpu load in % of one core.
instance_id	Number. Constant over process lifetime. Changes on process restart.
counters	Object. List of counters, with following sub members:
messages	Object. Each member name is the message name and its value is its occurrence. To get list of message, type <i>cevent help msg</i> in LTEIMS monitor.
errors	Object. Each member name is the error name and its value is its occurrence. To get list of message, type <i>cevent help msg</i> in LTEIMS monitor.
register	Register client to message generated by server. Message definition:
register	String or array of string. List of message to register to. Can be <i>users_update</i> , <i>sms</i>
unregister	String or array of string. List of message to unregister. Can be <i>users_update</i> , <i>sms</i>

6.6 LTE messages

```

users_get      Get users state.
                Message definition:
registered_only Optional boolean (default = false). If set, only registered user will be
                  dumped.

                Response definition:
users         Array of object. Each item represents a user with following parameters:
impi          String. IMPI of user (IP Multimedia Private identity).
force_sms_over_sg Optional boolean. Current SMS over SG forcing state.
bindings      Array of object. One for each contact binding:
uri           String. Contact URI.
impu          Array of strings. List of associated IMPUs.

```

	q	Number. Contact priority.
	video	Optional boolean. Video support.
	sms	Optional boolean. SMS pending.
	imei	Optional string. IMEI.
	expires	Integer. Number of seconds before binding expiration.
	dialogs	Array of object. One for each current dialog:
	remote	String. IMPI of remote user.
	sms	Integer. Number of pending SMS.
users_add	Add users. Message definition:	
	users.	Array of object. Same as info in configuration file: See [ue-db], page 13.
user_set	Configure user. Message definition:	
	impi	String. IMPI of user to configure.
	force_sms_over_sg	Optional boolean. Set/unset forcing of SMS over SG.
impu_set	Configure impu. Message definition:	
	impu	String. IMPU to configure.
	*	Same parameters as impu configuration object. See [impu configuration], page 14.
sms	Send SMS. Message definition:	
	impi	Optional string. IMPI of user (IP Multimedia Private identity).
	impu	Optional string. If IMPI is not set, try to get user from IMPU (IP Multimedia Public identity).
	text	String. SMS text to send.
	sender	Optional string. Sets SMS sender.
	validity	Optional integer (Default = 86400). Validity period in seconds.
	binary	Optional string. If set (and text is not set), must be a base64 string representing binary data of the TP-User-Data.
	binary_hex	Optional string. If set (and text is not set), must be an hexadecimal string representing binary data of the TP-User-Data.
	tp_udl	Optional integer. Used when binary is set. If present, it sets the TP-User-Data-Length field. If not present, the TP-User-Data-Length field is set to the number of octets of the binary field.
	tp_udhi_present	Optional boolean (default is false). When binary is set, indicates if TP-User-Data start with a user-data header or not.

	pid	Optional integer (default is 0). Defines protocol identifier.
	dcs	Optional integer (default is 4). Defines data coding scheme. If the text parameter was provided, it's up to the user to ensure that the dcs value is coherent with the encoding automatically selected (7 bit default GSM alphabet or UCS2).
mms	Send MMS. Message definition:	
	filename	String. File name to send. Extensions jpg, jpeg, png, gif and txt are supported.
	from	String. Sender phone number.
	to	String. Receiver phone number.
	sos	Optional boolean (default = false). If set, will only try to reach emergency registered UEs.
mt_call	Initiate a mobile terminating call. Message definition:	
	impi	String. IMPI (IP Multimedia Private identity) of user to call.
	impu	String. IMPU (IP Multimedia Public identity) of user to call.
	contact	String. Contact SIP uri of user to call.
	sip_file	Optional string. Define file to use as sdp. Will override <i>mt_call_sdp_file</i> parameter.
	caller	Optional string. Use it to force caller IMPU. If IMPU is in user database, the P-Asserted-Identity header will be added.
	sos	Optional boolean (default = false). If set, will only try to reach emergency registered UEs.
	duration	Optional number. If set, call duration in seconds (The server will close the dialog).
	Response definition:	
	session_id	String. If call has started, provides its session ID.
dialog_get	Get list of current pending dialogs. Dialog will persist 30s after being stopped. Message definition:	
	session_id	Optional string. If set, filter on session ID.
	Response definition:	
	dialogs	Array of object representing dialogs as follow:
	session_id	String. Dialog session ID.
	state	String. Dialog state, can be init , ringing , start , hold or stop .
	type	String. Dialog type, can be server , echo or mt call

to	Callee IMPU.														
from	Caller IMPU.														
mt_dialog	Optional string. In case of server dialog, session id of associated MT dialog.														
mo_dialog	Optional string. In case of client dialog, session id of associated MO dialog.														
date	Integer. Dialog creation time in seconds since 1st January 1970.														
duration	Number. Number of seconds since dialog has started.														
event_list	<p>Array of object representing events that has occurred during dialog lifetime.</p> <p>Each element have the following definition:</p> <table> <tr> <td>type</td><td>String. Event type, can be state, when a state change occurs, send and recv when receiving or sending message.</td></tr> <tr> <td>timestamp</td><td>Number. Event time in seconds since dialog creation.</td></tr> <tr> <td>state</td><td>String. Dialog state when event has occurred as defined above.</td></tr> </table>	type	String. Event type, can be state , when a state change occurs, send and recv when receiving or sending message.	timestamp	Number. Event time in seconds since dialog creation.	state	String. Dialog state when event has occurred as defined above.								
type	String. Event type, can be state , when a state change occurs, send and recv when receiving or sending message.														
timestamp	Number. Event time in seconds since dialog creation.														
state	String. Dialog state when event has occurred as defined above.														
medias	<p>Array of object representing media state.</p> <p>Each media is an object having following definition:</p> <table> <tr> <td>type</td><td>String. Media type, can be audio or video.</td></tr> <tr> <td>qos</td><td> String. QoS state, can be: <ul style="list-style-type: none"> • disabled: QoS not enabled, IETF mode used. • required: QoS required but not yet initiated. • pending: QoS dedicated bearer establishment in progress. • erab_set: QoS done. </td></tr> <tr> <td>dir</td><td>String. Media current direction, can be sendrecv, sendonly, recvonly or inactive.</td></tr> <tr> <td>rtp_addr</td><td>String. RTP packets destination address.</td></tr> <tr> <td>rtp_recv_count</td><td>Integer. Number of RTP packets received.</td></tr> <tr> <td>rtp_send_count</td><td>Integer. Number of RTP packets sent.</td></tr> <tr> <td>rtcp_addr</td><td>String. RTCP packets destination address.</td></tr> </table>	type	String. Media type, can be audio or video .	qos	String. QoS state, can be: <ul style="list-style-type: none"> • disabled: QoS not enabled, IETF mode used. • required: QoS required but not yet initiated. • pending: QoS dedicated bearer establishment in progress. • erab_set: QoS done. 	dir	String. Media current direction, can be sendrecv , sendonly , recvonly or inactive .	rtp_addr	String. RTP packets destination address.	rtp_recv_count	Integer. Number of RTP packets received.	rtp_send_count	Integer. Number of RTP packets sent.	rtcp_addr	String. RTCP packets destination address.
type	String. Media type, can be audio or video .														
qos	String. QoS state, can be: <ul style="list-style-type: none"> • disabled: QoS not enabled, IETF mode used. • required: QoS required but not yet initiated. • pending: QoS dedicated bearer establishment in progress. • erab_set: QoS done. 														
dir	String. Media current direction, can be sendrecv , sendonly , recvonly or inactive .														
rtp_addr	String. RTP packets destination address.														
rtp_recv_count	Integer. Number of RTP packets received.														
rtp_send_count	Integer. Number of RTP packets sent.														
rtcp_addr	String. RTCP packets destination address.														

rtcp_rcv_count

Integer. Number of RTCP packets received.

rtcp_send_count

Integer. Number of RTCP packets sent.

dialog_stop

Forces termination of a dialog.

Message definition:

session_id

String. Session ID of dialog to stop.

dialog_answer

Triggers INVITE final answer of an echo called configured with **remote_control** option.

Message definition:

session_id

String. Session ID of dialog to stop.

code

Optional integer. If set, forces answer SIP code.

reinvite Forces sending of INVITE of a started dialog.

Message definition:

session_id

String. Session ID of dialog.

unregister

Force a network deregistration of a binding. Message definition:

uri

String. Binding URI (Address of Record)

6.7 LTE events

Following events are sent by IMS if they have been registered on WebSocket.

sms

Generated by SMS reception:

sender

String. SMS originator.

destination

String. SMS destination.

text

String. SMS text.

binary

String. If **text** is not set, base64 encoded string of SMS data.

dcs

Integer. Data coding scheme.

users_update

Event generated when a change occurs on a user (Registration, call, sms...).

users_update

Array of object. Each item represents a user (See [users_get], page 23).

6.8 Examples

1. Config

1. Client sends

```
{  
  "message": "config_get",  
  "message_id": "foo"  
}
```

2. Server replies

```
{  
  "message_id": "foo",  
  "message": "config_get",  
  "name": "UE",  
  "logs": {  
    "phy": {  
      "level": "error",  
      "max_size": 0  
    },  
    ...  
    "rrc": {  
      "level": "debug",  
      "max_size": 1  
    }  
  }  
}
```

2. Error

1. Client sends

```
{  
  "message": "bar",  
  "message_id": "foo"  
}
```

2. Server replies

```
{  
  "message_id": "foo",  
  "message": "bar",  
  "error": "Unknown message: bar"  
}
```

7 Command line monitor reference

The following commands are available:

help Display the help. Use **help *command*** to have a more detailed help about a command.

log [log_options]
 Display the current log state. If *log_options* are given, change the log options. The syntax is the same as the **log_options** configuration property.

mme Lists MME connections

sms *impi* or *impu text*
 Send a SMS to the user identified by *impi* or *impu* if *impi* has not been found.

sms_flush *impi*
 Flush pending SMS.

mms *filename from to*
 Send a MMS to the user identified by *to*. Extensions jpg, jpeg, png, gif and txt are supported. For any other extension value, the content type is interpreted as octet stream.

mt_call *callee* [-d *duration*] [*sip_file*] [*caller*]
 Initiate a mobile terminating call.
 callee can be IMPI, IMPU or contact URI.
 sip_file Define file to use as sdp. Will override *mt_call_sdp_file* parameter.
 caller can be used to force caller IMPU. If IMPU is in user database, *duration* duration of the call in seconds before server closes it.
 the P-Asserted-Identity header will be added.

dialog Lists all dialogs.

dialog_stop *dialog index*
 Stops dialog.

reinvite *dialog index*
 Forces sending of INVITE of a started dialog.

quit Stop the program and exit.

8 Log file format

8.1 IMS, SIP

When a message is dumped, the format is:

```
time layer dir id message
```

time Time using the selected format.

layer Indicate the layer.

dir FROM or TO or - (No direction associated).

id For IMS, represents a unique ID associated with a UE binding.
For SIP, represents a unique ID associated to a SIP dialog.

message Log message.

8.2 CX, RX

When a message is dumped, the format is:

```
time layer dir addr message
```

time Time using the selected format.

layer Indicate the layer.

dir FROM or TO or - (No direction associated).

addr Source IP address for incoming messages.
Destination IP address for outgoing messages.

message Log message.

8.3 MEDIA

When a message is dumped, the format is:

```
time layer id dir protocol/media message
```

time Time using the selected format.

layer Indicate the layer.

dir FROM or TO or - (No direction associated).

id SIP associated dialog id.

protocol Can be either RTP or RTCP.

media Media type: **audio**, **video** or **text**.

message Log message.

9 Change history

9.1 Version 2022-06-18

- OpenSSL library is upgraded to 1.1.1n
- `code` parameter in `impu` objet now accepts the value -1 to ignore an incoming SIP message
- `tcp_keepalive` is added to control keepalive on TCP sockets
- allowed dual emergency/non emergency registration
- `sos` option is added to `mt_call` and `sms` remote APIs
- `start_timestamp` and `end_timestamp` are added to `log_get` API

9.2 Version 2022-03-18

- IMEI is now taken into account to improve calls between UEs using the same IMSI
- `binding_expires` parameter maximum value is increased from 3600 to 864000

9.3 Version 2021-12-17

- a new `sdp_file` parameter is added to force the SDP used in echo mode
- a new `answer_delay` parameter is added to IMPU configuration to delay final answer to INVITE request
- a new INVITE.OK option has been added to `method` parameter of IMPU configuration to apply `code` on final answer to INVITE request.
- a new `remote_control` option has been added to IMPU configuration. It can be handled via a new `invite` remote API event and a new `dialog_answer` remote API.
- a new `transparent` option has been added to IMPU configuration to avoid affecting normal callflow.
- a new `impu_set` remote API is added to dynamically update impu configurations.
- REGISTER handling has been added to `impu method` parameter.
- INVITE.TRYING handling has been added to `impu method` parameter.
- `license` monitor command is added

9.4 Version 2021-09-17

- the minimum GLIBC version is now 2.17
- logs can be displayed with microseconds precision
- `precondition` global parameter syntax is updated. Legacy boolean values are still available but we recommend to use `on` and `off` instead
- `force_user_agent` parameter is added to avoid overriding the UE user-agent string when forwarding SIP packets between UEs
- `prefered` parameter is renamed to `preferred`. Legacy name is still supported
- the logging format is further described
